

## ICEBREAKING

Ice conditions were unusually light during this DEEP FREEZE. Only once did the ship become ice-bound and, thanks to the efforts of our competent engineering personnel, we were able to utilize all ten of GLACIER's main diesel engines to generate the power needed to free us without unreasonable delay.

The majestic Mount Erebus, shown on the facing page, served us well as a landmark during all icebreaking and science operations we performed in the Ross Sea.

GLACIER drives forward through the floe, following the crack.

The floe is successfully broken and BIG RED moves into open water.
