

Mount Siple

Of much interest to the scientific world, and Polar Sea, Mount Siple was studied by three scientists working in conjunction with U.S. Geological Survey. The purpose of the study was to determine whether or not the mountain is an active volcano. After overflights and ground work, it was found not to be active at this time.

At the top: Siple Island.

Above: 1 to 4 — Gordon Shupe, leader of the Siple expedition; Ian Diales, senior scientist; the captain, Dr. Jeffries.

Right: The moon came out on one of the last nights at the mountain.
